PFAS Reference Materials

PFAS

What you need to know

Per- and polyfluoroalkylated substances (PFAS) have garnered much attention in recent years as legislators around the world have begun to ban or limit their use.

The impact in Europe

Several PFAS compounds have come under the scrutiny of the Stockholm Convention on Persistent Organic Pollutants (POPs) including PFOA, PFOS, PFOSF, PFHxS, associated salts and other related compounds.

Towards the end of 2020, food regulators in the European Union set a limit for combined exposure to PFOA, PFOS and two other PFAS compounds in food – perfluorononanoic Acid (PFNA), perfluorohexane sulphonic Acid (PFHxS).

More regulation followed to regulate the presence of PFAS in drinking water and groundwater within the European Water Framework Directive to safeguard consumer and environmental health.

And most recently, authorities in Denmark, Germany, Netherlands, Norway and Sweden are calling for further restriction or banning of PFAS compounds under REACH.

The impact in America

The U.S. Senate's PFAS Release Disclosure and Protection Act of 2019 requires the regulation of PFAS in relation to safe drinking water and management of toxic chemicals. The bill also required 172 specified PFAS to be immediately included in the Toxics Release Inventory (TRI) of the Environmental Protection Agency (EPA).

In 2020, the EPA outlined its strategic roadmap including timelines and key actions, to safeguard public health and the environment, and hold polluters accountable.

History & environmental impact

PFAS have been in use in manufacturing since the 1950s, for cookware coatings, food packaging, firefighting foam, textiles, clothing and other household goods. Unfortunately, the same properties which make PFAS so useable – hardness, oil and water resistance – also make these compounds incredibly environmentally persistent, lending them the nickname ‘forever chemicals’. This tenacity is largely down to the carbon and fluorine bonds that make up PFAS molecules, meaning that soil, air, and water contamination may be widespread. One report by the Centre for Disease Control (CDC) detected PFOS, PFOA, PFNA, and PFHxS in the blood of more than 95% of the U.S. population over 12 years old.

A growing global legal issue

The legal ramifications of the emerging PFAS problem are significant. To date, over 5000 PFAS-contaminated sites have been identified in the United States, and legal actions have been successfully brought against multiple manufacturers. Meanwhile, despite the Australian government’s claim that there is “limited to no evidence” linking PFAS to human disease, one law firm still reached an in-principle agreement with the Australian Department of Defence. They secured a reported \$212.5 million AUD for three communities affected by PFAS contamination linked to PFAS compounds on army bases, fire stations and industrial sites from the 1970s to the 2000s.

Countless compounds, endless research

There are thousands of different types of PFAS compounds, all varying in the threat they pose to human, animal and environmental health. So the research and monitoring that’s needed to set standards on a case-by-case basis is lengthy and highly resource-intensive. To date, a core group of more widely used compounds has dominated research and become regulated by bodies such as the EPA and European Union. For those that the industry is still gaining intelligence on, there are simply guidance measures in place.

Our PFAS portfolio

Over the following pages, we’ll introduce you a selection of our PFAS-related products, including both neat and single solutions. Our EPA method tailored solutions improve the efficiency of your laboratory, while our stable Isotopically Labelled products (SIL) give you a range of options for your testing needs. You’ll also see our latest PFAS mixtures which support the EU Drinking Water Directive, UCMR5 and EPA Method 1633.

PFAS reference materials

Product Listings

LGC brings you a comprehensive range of reference materials for PFAS testing through our Dr. Ehrenstorfer portfolio, and matrix materials through our preferred partners The National Institute of Standards and Technology (NIST) and Joint Research Centre (JRC).

Ehrenstorfer Quality

At Dr. Ehrenstorfer we place an emphasis on quality as part of our commitment to providing you with products you can trust. Here is what 'Ehrenstorfer Quality' means to us:

Producing to the highest standard

Dr. Ehrenstorfer reference materials are produced to the highest quality, with all analytical measurements performed under our ISO/IEC 17025 scope of accreditation and a leading portfolio of products produced according to our ISO 17034 accreditation. We use the most advanced analytical techniques to characterise our reference materials so that you can rely on the scientific integrity of the data contained in your Certificate of Analysis.

Ensuring confidence from characterisation to implementation

We use real-time stability testing and expiry date management to give you confidence in your Dr. Ehrenstorfer reference materials and ensure you receive your products as certified, ready for your analysis. Our careful packaging choices protect your product during delivery and storage, and are made with your convenience and safety in mind.

Offering a unique and extensive portfolio

We produce an unrivalled portfolio of reference materials for food and environmental analysis, including unique substances, stable isotope labelled compounds and metabolites. Dr. Ehrenstorfer continues to be a global leader in pesticides and our range also features pharmaceutical and veterinary compounds, food related compounds, dyes, food packaging contaminants and more. We offer multiple formats including neats, single and multicomponent solutions.

Understanding your analytical needs

Through direct interactions with our customers and our expertise in the latest scientific and regulatory developments, we are able to quickly adapt our portfolio of reference materials to address your needs. We are committed to providing you with trusted solutions, today and tomorrow.

Providing expert support

At Dr. Ehrenstorfer we combine experience with continuous training to ensure that the latest knowledge and skills are being applied to producing your reference materials. As part of the LGC family, we are proud to connect with our customers across a global network, with dedicated local teams able to support your reference materials decisions and the implementation of our products in your analytical testing.

Our heritage, our vision, your guarantee

Dr. Ehrenstorfer is built upon more than 40 years of history in planning, developing, producing, analysing, packaging and delivering high quality reference materials to our customers around the world with speed and reliability. We are passionate about our work which supports you in your science for a safer world.

PFAS reference materials

Product Listings

Since 1975, Dr. Ehrenstorfer™ has led the way in producing pesticide reference standards. Today, our portfolio has expanded to adapt to changing regulations and technology.

- Over 200 PFAS reference materials
- 40% of PFAS products produced to our ISO 17034 accreditation
- Popular tailor-made mixtures for EPA and other regulatory methods
- Centres of excellence in Germany and United States
- As part of the LGC family, we're proud to connect with our customers across a global network, with dedicated local teams ready to support your needs

Order at
lgcstandards.com/drehrenstorfer

Introducing our latest PFAS mixtures to support the EU Drinking Water Directive, UCMR 5 and EPA Method 1633.

Improve efficiency.

Specifically designed to meet testing requirements, our UCMR 5 mixture has 29 analytes, our EU Drinking Water Directive mixture has 20 analytes and our EPA Method 1633 mixture has 40 analytes.

- ◆ No need to conduct stability studies or develop your own mixtures
- ◆ Reduce your calibration runs and save preparation time

Free up resources.

A higher concentration to give you clear signal intensity, even with the most difficult sample matrixes:

- ◆ Increase your efficiency with higher sample throughput
- ◆ Save time compared to preparing your solutions in-house

Have confidence in your results.

A robust ISO 17034 mixture designed by our team of expert chemists.

- ◆ Decrease your likelihood of downtime
- ◆ Reduce issues
- ◆ Avoid error-prone preparations

Stable Isotopes

Our range of PFAS reference materials include ¹³C stable isotope labeled PFAS compounds to support regulatory testing requirements and improved analytical accuracy including when working with complex matrices. Available in single solution format and accredited to ISO 17034 to provide you confidence in your results.

Per- and Polyfluorocarboxylic Acids (PFCA)

Per- and polyfluorocarboxylic Acids are organofluorine analogues of ordinary carboxylic acids. They exhibit hydrophobic properties and are widely used in the synthesis of peptides. Longer chain perfluorocarboxylic acids such as perfluorooctanoic Acid (PFOA) are used in firefighting foams and are under increased scrutiny due to their bioaccumulative properties.

Per- and Polyfluorosulfonic Acids

Per- and Polyfluorosulfonic Acids (PFSAs) are a subgroup of per- and polyfluoroalkyl substances (PFAS) characterized by a sulfonic acid functional group. Due to their exceptional stability and resistance to degradation, PFSAs have been widely used in various industrial applications, including stain-resistant fabrics, firefighting foams, and non-stick cookware. Their persistence in the environment and human body has raised significant health and environmental concerns, with studies linking PFSAs to adverse effects such as cancer, hormone disruption, and immune system impacts. Due to these risks, regulatory efforts are increasingly aimed at reducing their use and managing their environmental presence.

Fluorotelomer Alcohols (FTOH)

Volatile precursors to perfluorinated carboxylic Acids (PFCAs), fluorotelomer alcohols (FTOHs) are fluorotelomers with an alcohol functional group. FTOHs are environmental contaminants characterised by high volatility, prone to long-range atmospheric transport. FTOHs have been identified in consumer products, including stain repellents and windscreen wiper fluid.

Perfluoroalkyl Sulfonamides

Perfluoroalkyl sulfonamides (PFASAs) are a subclass of per- and polyfluoroalkyl substances (PFAS) characterised by their strong carbon-fluorine bonds and the presence of a sulfonamide group. These compounds are known for their exceptional chemical stability, resistance to heat, water, and oil repellency. Due to these properties, PFASAs have been widely used in various industrial applications, including as surfactants, lubricants, and in the production of non-stick coatings and textiles. However, their environmental persistence and potential health impacts have raised significant concerns, leading to increased regulatory scrutiny and efforts to find safer alternatives.

Polyfluoroalkyl Acrylates

Polyfluoroalkyl acrylates are a class of per- and polyfluoroalkyl substances (PFAS) used primarily as polymerization agents in the production of water and stain-resistant coatings, textiles, and paper products. Despite their beneficial applications, polyfluoroalkyl acrylates raise environmental and health concerns due to their persistence and potential to degrade into more stable and bioaccumulative PFAS, such as perfluorooctanoic acid (PFOA). Consequently, there is growing regulatory scrutiny and research focused on safer alternatives and the environmental impact of these substances.

Polyfluorinated Phosphate Esters

Polyfluorinated phosphate esters are a class of PFAS compounds that have useful properties including high stability, low surface tension and resistance to heat and chemicals. Therefore, they are often used as surfactants, lubricants and in fire-retardant applications. However, despite their useful applications they have raised concerns in the scientific community due to their persistence in the environment and potential health risks.

Per- and Polyfluoroalkyl Ether Carboxylic Acids

Per- and polyfluoroalkyl ether carboxylic acids are a type of perfluorinated compound used in various industrial applications such as surfactants, lubricants and coatings. They are particularly sought after as they are exceptionally stable, water and oil repellent and resistant to heat and chemicals. However, like with other PFAS compounds they are under scrutiny for their persistence in the environment and potential health effects making them a crucial group of compounds to test for.

Matrix Materials

Due to their persistent nature, PFAS compounds bioaccumulate in various matrices, including water, soil, sediment, air, and biological matrices. The interaction between PFAS compounds and these matrices can complicate analyses. Therefore, the use of matrix materials plays a crucial role in understanding these effects. LGC offers a comprehensive range of matrix materials for PFAS testing, thanks to our partnerships with leading reference material producers.
